Jet Diffusers

PUBLICATION

DIFFUSERS 8

JANUARY 2013

## Features

- Jet Air Stream Distribution.
- Wide Directional Adjustment.
- Long Throw Capability
- Reversible Diffuser Nozzle Provides full or reduced Jet Pattern.
- High Volume Capacity.
- Low Noise Level
- Aluminium Construction.

# SERIES JN

## Jet Diffusers

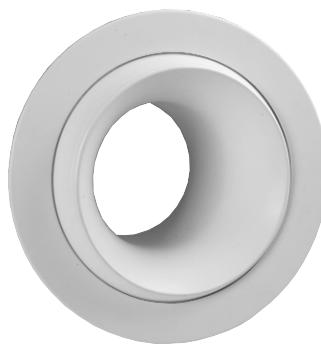

### Introduction

Gilberts JN Series of Jet Nozzles are highly versatile units capable of delivering a powerful stream of air over long distances. Its ability to deliver an accurate airstream makes it ideal for spot heating or cooling applications and for ventilating areas where either for aesthetic reasons or perhaps lack of space, branch ducts cannot be accommodated. Its wide angular movement allows the airstream to be delivered through a wide area of direction (+/- 30° in full jet position and +/- 10° in reduced jet position) and with great precision. In addition the diffuser ball is fully reversible, rotating through 180° to provide either a full or reduced jet pattern. As well as single

module assemblies units can be banked in both horizontal and vertical arrays to provide multiple fields of coverage from a single position. Available in 5 different sizes, 160, 200, 250, 315 and 400 dia, to suit standard ISO duct sizes JN Series is manually adjusted to its set position however motorised options are available. Matching plenum boxes can also be designed with volume control available on the plenum inlet in manual quadrant or iris damper options. Standard finish on the JN Series is a Polyester Powder White with other colours available on request.

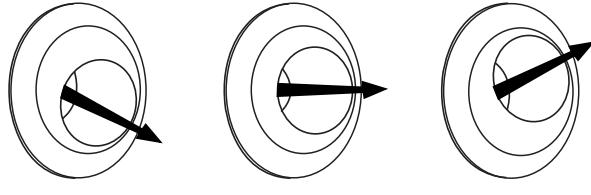

Full Jet Position

Reduced Jet Position

### Features

- Jet air stream distribution.
- Wide directional adjustment.
- Long throw capability.
- Reversible Diffuser Nozzle Provides Full or Reduced Jet Pattern.
- High volume capacity.
- Low noise level.
- Aluminium construction.

(+/- 10° in Reduced Jet Setting)

### Performance Data

The performance tables listed in this brochure relate to isothermal heating and cooling applications. Performance figures for throw, pressure drop and also sound data under isothermal conditions can be found in the sizing performance tables on pages 7, 8, and 9. These performance figures are based on the diffuser set in the full jet and not reduced jet position. Value reductions for reduced jet position are indicated. Corresponding figures showing the rise and fall of the jet stream under heating and cooling conditions can be found in the rise and fall charts on pages 10 to 15, with angular corrections indicated on page 18. Vertical performance tables under heating conditions are given on page 19, with angular variances calculated from figures given on pages 16 and 17.

### References Used

PRESSURE: All pressures are in Pa (N/m<sup>2</sup>)

THROW: All terminal velocity figures in (m/s) as indicated in the performance charts

SOUND: All figures given in (dBa)

### SELECTION PROCEDURE

Dependant upon the Jet Diffuser positions worked examples on pages 3 and 19 will guide the designer in the use and selection procedures for either horizontal or vertical applications.

## Selection Procedure

### HORIZONTAL THROW EXAMPLE (ISOTHERMAL CONDITIONS)

Air volume is  $0.425\text{m}^3/\text{s}$  and a throw of 18m is required with a terminal velocity of  $0.5\text{m/s}$ . Initially refer to the sizing charts on pages 7, 8 and 9. Using air volume as your primary factor search for the closest air volume to your requirements in the left hand columns of the sizing chart tables. Each table refers to a specific Jet Diffuser size and you may find that more than one size can accommodate your air volume. Throw requirements can then be read off on the horizontal axis to reveal the unit with the closest terminal velocity to your needs.

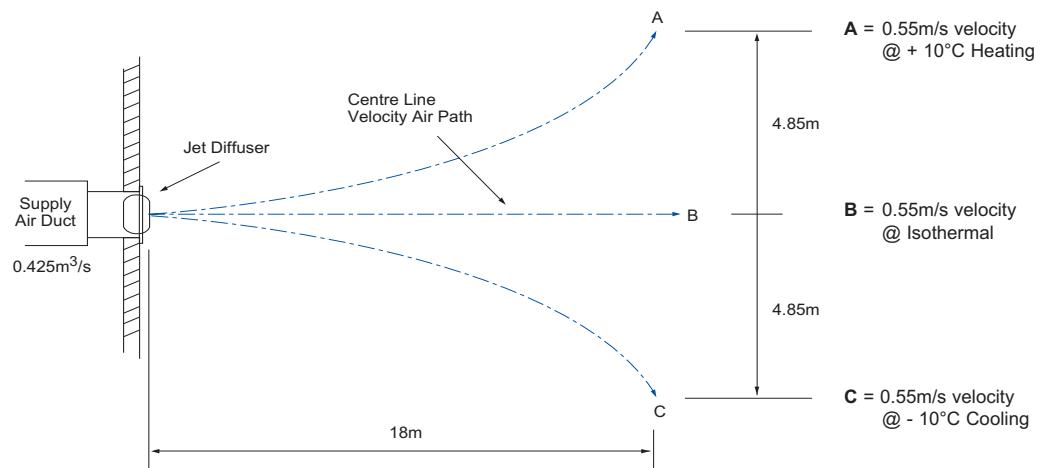

### HEATING AND COOLING ALLOWANCES

When a temperature difference between supply air and room air exists we can calculate the rise and fall of any airstream.

Using the initial data from our horizontal throw example we can add a temperature differential and determine the effect on performance. For example the effect of a temperature differential of  $10^\circ\text{C}$  heating or cooling can be calculated using our rise and fall charts on pages 10 to

In this example a 400 dia. Jet Diffuser gives the closest match. At  $0.425\text{m}^3/\text{s}$  and an 18m throw the terminal velocity is  $0.55\text{m/s}$ . The table also indicates that at this volume the pressure drop will be 58 Pa and the noise level 35 dbA.

15, (other temp. differentials are also listed). Reviewing our example size 400 dia. we can see from the Size 400 dia. Rise and Fall chart on page 13 that for an air volume of  $0.425\text{m}^3/\text{s}$  at 18m throw and  $10^\circ\text{C}$  temp. differential the airstream will rise or fall by 4.85m (see diagram below).

### ANGULAR SETTING OF JET DIFFUSERS

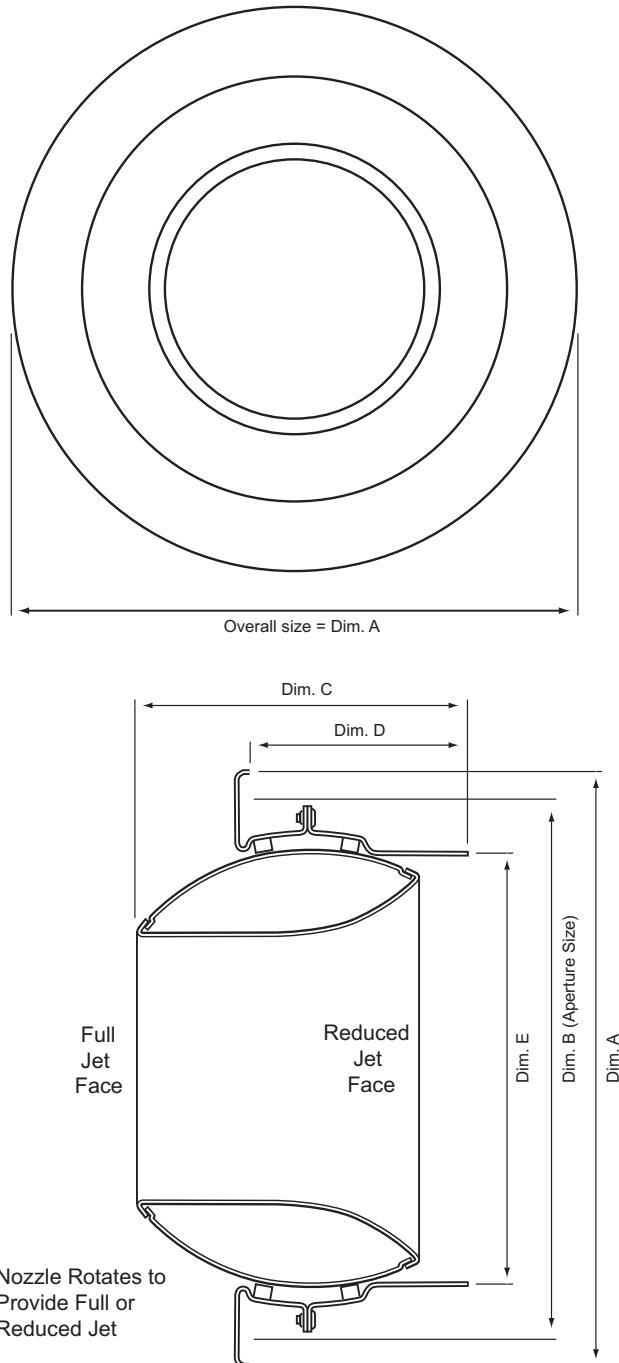

Once the throw is established we can use the angular discharge correction chart on page 18 to determine the vertical angular correction required on the diffuser position to achieve a horizontal throw. In our example at 18m throw we have a rise/fall effect of 4.85m. The

nearest factor available on the chart indicates that a  $14^\circ$  adjustment would correct a 4.5 rise/fall at 18m. From this we can estimate that a  $15^\circ$  angular adjustment would correct to near horizontal throw desired at 18m

#### Single Units

All figures based on isothermal conditions with unit set in Full Jet position and directed centrally through a 10m x 10m envelope.

For units set in the reduced jet position the above figures should be reduced by 40%.

#### Multiple Units

Please bear in mind that as a general rule an increase in throw of up to 40% can be achieved for each jet diffuser positioned within 300mm of another unit. For multiples above 3 simulations should be run to accurately predict throw.

## Jet Diffusers

### Angular Discharge Correction Chart

	THROW (METRES)											
	3	6	9	12	15	18	21	24	27	30	36	
0.03	1	1	1									
0.15	3	2	1	1								
0.30	6	3	2	1	1	1						
0.60	11	6	4	3	2	2	2					
1.20		11	8	6	5	4	3	3				
1.80		17	11	9	7	6	5	4	4			
2.40		22	15	11	9	8	7	6	5	5		
3.00		27	18	14	11	10	8	7	6	6		
4.50			27	21	17	14	12	11	9	9	7	
6.00				27	22	18	16	15	12	12	10	
7.20					27	23	20	17	16	14	12	
9.15						27	23	21	18	17	14	
10.66							27	24	21	19	16	
12.20								27	24	22	18	
13.72									27	25	21	
15.24					CORRECTION IN DEGREES						23	
16.77											25	
18.30											27	

Please bear in mind that as a general rule an increase in throw of up to 40% can be achieved for each jet diffuser positioned within 300m of another unit. For multiples above 3 simulations should be run to accurately predict throw.

## Correctional Figures for Angular Variance to Vertical Performance

Take Maximum Throw ( $T_M$ ) from Tables

$$\begin{aligned} \text{Hence, } d &= K_1 T_M \\ L &= K_2 T_M \end{aligned}$$

$\theta^\circ$	$K_1$	$K_2$
0 -10	1.00	0.00
11 -20	0.98	0.45
21 -30	0.91	0.86
31 -40	0.81	1.21
41 -50	0.67	1.28
51 -60	0.52	1.60
61 -70	0.35	1.59
71 -80	0.20	1.43
81 -90	0.07	1.07

### VERTICAL THROW EXAMPLE (ISOTHERMAL CONDITIONS)

Select and size Jet Diffuser from sizing charts on pages 7, 8 and 9 in accordance with the first part of the selection procedure on page 2.

### VERTICAL THROW (HEATING)

A requirement for 10°C heating is required at a volume of 0.3 M<sup>3</sup>/s to throw vertically to floor level 10m away.<sup>3</sup>

To select a Jet Diffuser size we simply view our table on page 16.

Reviewing  $D_t = 10^\circ\text{C}$  chart with a volume of 0.3 m<sup>3</sup>/s gives a 400 Dia. Jet Diffuser selection to give a 10m throw to 0.1m/s terminal velocity. Therefore a size 400 Dia. JN unit should be selected.

### VERTICAL THROW ANGULAR ADJUSTMENT (HEATING)

All previous data has assumed a direct vertical discharge, although we can calculate a throw pattern for an angular discharge using our table above.

Using the previous data of +10°C  $D_t$  and 0.4m<sup>3</sup>/s we can calculate the new air path by using the listed formulas, assuming a 30° angle, by using the formula stated.

Discharge at 30° off set from vertical

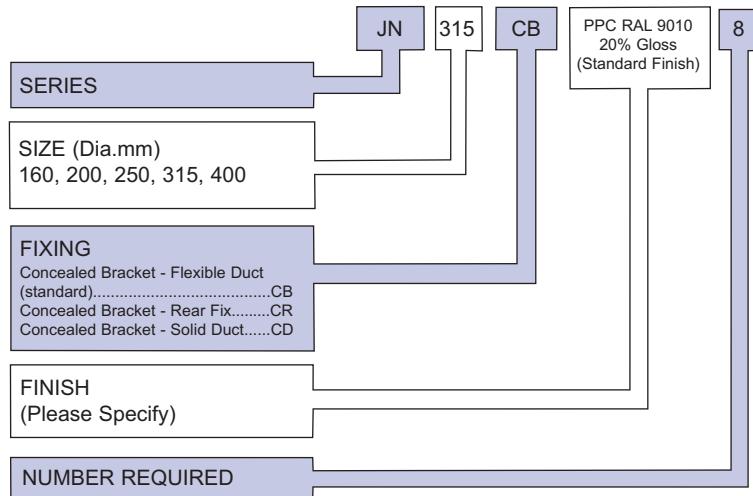

$$d = K_1 \times T_M, \quad d = 0.91 \times 10\text{m}, \quad d = 9.1\text{m vertical}$$

$$L = K_2 \times T_M, \quad L = 0.86 \times 10\text{m}, \quad L = 8.6\text{m horizontal}$$

## Ordering Specification

### FINISH

Standard Finish: Polyester Powder Coat White  
RAL 9010 20% Gloss.  
Special Finishes: PPC to Stock BS or RAL colour.

### SIZE RANGE

Available in sizes 160, 200, 250, 315 and 400mm diameters
